Random vibration. Eq. (2.29) is not mathematically valid in the case of non-uniform flow because the power spectral density (PSD) of the excitation force, $S_F(\omega) (=2G(\omega))$ depends on the axial location along the tube. To avoid this problem, the following two approximate methods are applied: 1. The frequency composition of the excitation force is considered to be constant even if the flow ...

Random Forcing Function and Response

This is the first comprehensive text on its subject to appear since the 1960s. It incorporates classical material with the many significant developments in the field and is the only up-to-date introduction currently available.
