Anatomy and Physiology - CliffsNotes Study Guides

A joint, also called an articulation, is any place where adjacent bones or bone and cartilage come together (articulate with each other) to form a connection. Joints are classified both structurally and functionally. Structural classifications of joints take into account whether the adjacent bones are strongly anchored to each other by fibrous connective tissue or cartilage, or whether the ...

Anatomy and Physiology - CliffsNotes Study Guides

The joint with the greatest range of motion is the ball-and-socket joint. At these joints, the rounded head of one bone (the ball) fits into the concave articulation (the socket) of the adjacent bone (see Figure 6.62f). The hip joint and the glenohumeral (shoulder) joint are the only ball-and-socket joints of the body.
