Carnitine Shuttle - an overview | ScienceDirect Topics

The differences between the course of the circulation in the embryo and in the adult are due to the fact that their centers of metabolic activity are differently located. The organs which in the adult carry out such functions as digestion and absorption, respiration, and excretion are extremely complex and highly differentiated structures.

MCQ Questions for Class 10 Science Chapter 6 Life ...

Excretion. Excretion is performed mainly by two small kidneys. In diapsids, uric acid is the main nitrogenous waste product; turtles, like mammals, excrete mainly urea. Unlike the kidneys of mammals and birds, reptile kidneys are unable to produce liquid urine more concentrated than their body fluid.

Human iron metabolism is the set of chemical reactions that maintain human homeostasis of iron at the systemic and cellular level. Iron is both necessary to the body and potentially toxic. Controlling iron levels in the body is a critically important part of many aspects of human health and disease.

Biology Questions and Answers Form 2 - High School Biology ...

The main function of the thyroid gland is to make hormones, T4 and T3, which are essential for the regulation of metabolic processes throughout the body. As at any factory, effective production depends on three key components - adequate raw material, efficient machinery, and appropriate controls. Iodine is the critical raw material, because 65% of T4 weight is iodine.

Palmitoyl-CoA, the normal end product of FA biosynthesis, inhibits acetyl-CoA carboxylase (see Chapter 56). As a final note, the liver cell may re-esterify some incoming LCFAs into TG, and export it into the circulation as a part of very low density lipoprotein (VLDL; see Chapter 65). In contrast, MCFAs are not normally utilized for TG ...
