A 5' cap (also termed an RNA cap, an RNA 7-methylguanosine cap, or an RNA m<sup>7</sup>G cap) is a modified guanine nucleotide that has been added to the "front" or 5' end of a eukaryotic messenger RNA shortly after the start of transcription. The 5' cap consists of a terminal 7-methylguanosine residue that is linked through a 5'-5'-triphosphate bond to the first transcribed nucleotide.
