Abstract. We address the problem of finding optimal hedging points of a production flow controller, in the sense of Bielecki and Kumar (1988). We model the dynamics of the controller by using generalized semi-Markov processes (GSMP); the GSMP framework lets us work with multiple states, and not only with exponential distribution but with fairly general distributions.

Optimal Flow Control for Continuous-time Scheduling in ...

In this paper, we consider the problem of the optimal flow control for a production system with one machine which is subject to failures and produces one part type. In most previous work, it has been assumed that the machine has exponential up and down times, i.e., its state process is a Markov process. The system considered in our study has general machine up and down times.

CiteSeerX — Computation Of Optimal Flow Control Policies ...

An optimal control formulation is established for the dynamic routing problem. A production flow control algorithm is developed based on a combination of mathematical modeling and heuristics. The control policy is simulated and a comparison with the numerical optimal solution shows that it performs well for the instances under consideration.
