Covalent bonds are the most important means of bonding in organic chemistry. The formation of a covalent bond is the result of atoms sharing some electrons. The bond is created by the overlapping of two atomic orbitals [1]. This process is illustrated in Figure 3-4. In this type of bond, each shared electron will be counted toward both atoms ...

A fluorine atom has an electronic structure of  $1s^2 2s^2 2p_x^2 2p_y^2 2p_z^1$ . It has 9 protons in the nucleus. The incoming electron enters the 2-level, and is screened from the nucleus by the two  $1s^2$  electrons. It therefore feels a net attraction from the nucleus of  $7+$  (9 protons less the 2 screening electrons).

In chemistry, an atom cluster (or simply cluster) is an ensemble of bound atoms or molecules that is intermediate in size between a simple molecule and a nanoparticle; that is, up to a few nanometers (nm) in diameter. The term microcluster may be used for ensembles with up to couple dozen atoms.. Clusters with a definite number and type of atoms in a specific arrangement are often considered a ...
