Computational complexity theory focuses on classifying computational problems according to their inherent difficulty, and relating these classes to each other. A computational problem is a task solved by a computer. A computation problem is solvable by mechanical application of mathematical steps, such as an algorithm.. A problem is regarded as inherently difficult if its solution requires ...

The complexity of a problem is the minimum running time (or minimum amount of resources, more generally) needed to solve some particular problem -- so a very similar notion. At this stage, don't get too caught up in trying to understand the precise definition of words like efficiency and complexity or trying to understand what the distinctions ...
